

## **Fire Safety Bulletin – Building Fire Safety Features**

Our campus buildings are equipped with a variety of features that are designed to stop the spread of fire, detect it or suppress it.

- Fire doors help stop the spread of smoke or fire. Fire doors protect corridors and stairwells, and should remain in the closed position.

- Smoke detectors are designed to detect low levels of smoke and sound an alarm. Most campus smoke detectors are connected to the building's fire alarm system.

- Sprinklers can distinguish a fire before it has time to spread. At a certain temperature, sprinklers operate quickly to allow water flow. Sprinklers effectively extinguish or minimize a fire.
